How can web-design be utilised to enhance the quality of a student's organisation and productivity?

Research & Define

- Expand my knowledge of the JavaScript coding language. I must then seamlessly apply this to the development of a piece of software tailored for the modern era.
- Study other existing web-apps and other existing products.
- Survey my targeted market and discover their needs in order to accommodate them.

Prototype & Test

- Develop a piece of software that is visually appealing and meets the user's expectations and needs based on survey data.
- Can functionally organise inputted tasks into smaller chunks in a visually aesthetic manner with multiple views of the information stored for ease.
- All while made in a secure back-end connection to a database using HTML, CSS, and JS.

Exhibit/ Share

- Offer my product to my targeted surveyed consumer: students and families, either as a free version for anybody to use (with potentially limited functionality).

OR

- A paid option to give the user full access to all resources on the site.
